## Abstracts

Fishery Solar Photovoltaic Project, also known as "Fishery - PV Hybrid Project", is a new - type industrial form that combines photovoltaic power generation systems with modern aquaculture organically without affecting the ecological functions of water areas. It realizes the three - way win of "fishery, electricity, and environmental protection". Working principle: By installing photovoltaic arrays on the water surface of aquaculture waters, it reserves the original aquaculture function and realizes the efficient utilization of clean energy. It adopts a three - dimensional development mode of "power generation on the water, aquaculture underwater". Photovoltaic panels convert solar energy into electricity, while the space under the panels is used for fish, shrimp, and other aquatic product breeding. Project advantages: 1) High-efficiency land use: It solves the problem of rigid land resource requirements of traditional ground - mounted photovoltaic projects, and significantly improves the economic benefits per unit area of water areas through "one - water, two - uses", achieving efficient utilization and ecological development of land resources. 2) Good ecological benefits: It can reduce water surface evaporation, inhibit the reproduction of algae, and form a micro - ecological environment conducive to fish growth. 3) Economic benefits: It can not only sell the generated electricity to obtain economic benefits but also ensure the normal development of the aquaculture industry. At the same time, some projects can also increase income by adjusting aquaculture varieties and increasing the breeding of aquatic products with higher added value.

The global Fishery Solar Photovoltaic Project market size was estimated at USD 8732.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 32.80% during the forecast period.
