Abstracts

A fisheye network camera is a specialized surveillance device that employs an ultra-wide-angle or hemispherical lens?typically offering a field of view of 180 degrees or more?to capture a panoramic or 360-degree view of a monitored area in a single image or video stream. These cameras are designed for network-based operation, transmitting video data over IP networks for remote viewing, recording, and analysis, and they often incorporate advanced features such as digital dewarping software to correct the characteristic distortion of fisheye imagery into rectilinear or multi-view layouts. Ideal for applications requiring broad coverage with minimal hardware, such as retail stores, large public spaces, or warehouses, fisheye network cameras reduce the need for multiple fixed-lens cameras by providing comprehensive situational awareness from a single installation point while integrating with broader security and IoT ecosystems.

The global Fisheye Network Camera market size was estimated at USD 1550.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
