Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Five-layer Co-extruded Infusion Film competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The Five-layer Co-extruded Infusion Film is a pharmaceutical packaging material formed by simultaneously extruding five distinct layers of polymer materials. Each layer serves a specific function, providing enhanced mechanical strength, barrier properties, and drug compatibility, ensuring the safety and integrity of infused medications. In 2024, global production reached approximately 52.04 million Sqm, with an average global market price of around US\$1.44 per Sqm. This product typically has a single-line production capacity of approximately 2-5 million square meters, with an industry gross profit margin of approximately 25%-35%. Raw materials account for the largest portion of the cost structure (approximately 60-70%), followed by labor costs and manufacturing expenses. The upstream suppliers of this product are plastic resins and additives, while the downstream suppliers are infusion bag and infusion preparation manufacturers. The five-layer co-extruded infusion film is an advanced non-PVC packaging material for medical solutions, produced by combining polymers like polypropylene and polyethylene through co-extrusion technology. Each layer is engineered for specific functions: the outer layers provide mechanical strength, the central layers enhance barrier properties, and the inner layer ensures compatibility with pharmaceuticals. This structure offers superior chemical stability, sealing performance, and safety, effectively protecting drugs from deterioration or contamination. Market growth is primarily driven by the healthcare sector's increasing demand for safer and more sustainable packaging. Strict regulations against traditional PVC bags (due to concerns over DEHP plasticizers) are accelerating the adoption of non-PVC alternatives. Key industry trends include material innovations for improved

barrier functions and the integration of smart features, such as temperature or fill-level monitoring, to cater to sensitive therapies like biologics. The supply chain involves upstream suppliers of medical-grade resins, midstream film producers requiring precision engineering, and downstream infusion bag manufacturers and healthcare providers. Moving forward, the industry is evolving toward safer, smarter, and more environmentally friendly solutions, though balancing advanced technology with cost-effectiveness remains an ongoing focus.

The global Five-layer Co-extruded Infusion Film market size was estimated at USD 75.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
