Abstracts

The fixed displacement axial piston pump is a hydraulic pump with the advantages of compact structure, high efficiency, and strong self-priming ability. Its working principle is based on an axial piston pump, which achieves oil suction and pressure through the reciprocating motion of the plunger in the cylinder. The flow rate of a quantitative pump is determined by the structural parameters of the pump and is usually indirectly controlled through air valves and liquid valves, forming a closed-loop system with stepless speed regulation. Axis piston fixed displacement pump is mainly suitable for occasions with certain flow requirements, relatively stable hydraulic system, and high flow control requirements.

The global Fixed Displacement Axial Piston Pumps market size was estimated at USD 1254.24 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.20% during the forecast period.
