Abstracts

A fixed-focus camera module refers to a camera system with a lens set to a specific focal length that cannot be adjusted. Unlike adjustable or autofocus cameras, where users can manually or automatically change the focus, a fixed-focus camera module is set to capture images at a fixed distance. **Cost-Effective Solutions:** Fixed-focus camera modules are often chosen for applications where cost is a significant factor. These modules tend to be more economical to produce compared to adjustable focus or autofocus systems, making them attractive for budget-sensitive projects. **Specific Use Cases:** Fixed-focus cameras are commonly employed in applications with a consistent and known working distance. For example, they are often used in industrial settings for barcode scanning or in surveillance cameras where the target distance is relatively constant. **Advancements in Technology:** While fixed-focus modules may seem basic compared to more sophisticated autofocus systems, there have been continuous technological improvements. Manufacturers may enhance image sensor capabilities, optimize lens designs, or integrate features to improve image quality and performance. **Integration in Consumer Electronics:** Fixed-focus cameras are sometimes used in entry-level or budget-friendly consumer devices where simplicity and cost are prioritized over advanced camera features. This includes some lower-end smartphones, webcams, and other consumer electronics.

The global Fixed Focus Camera Module market size was estimated at USD 535.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
