## Abstracts

A fixed thermal fogging machine is a device that is designed to generate a fine mist or fog by using heat to vaporize a liquid substance. It is usually installed in a fixed location and is mainly used in various fields such as agriculture, horticulture, disinfection, and pest control. This type of fogging machine typically consists of a heating element, a liquid storage tank, a delivery system, and a control unit. The heating element rapidly heats the liquid in the storage tank to a certain temperature, causing the liquid to vaporize and form a fine fog. The delivery system then disperses the fog into the surrounding environment. The control unit is used to adjust and monitor parameters such as the heating temperature, fogging volume, and fogging time to meet different application requirements.

The global Fixed Thermal Fogging Machine market size was estimated at USD 2282.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.70% during the forecast period.
