Abstracts

A fixed wing LiDAR drone is an unmanned aerial vehicle (UAV) that integrates a LiDAR (Light Detection and Ranging) sensor with a fixed wing airframe design, enabling the collection of high-resolution, three-dimensional geospatial data over large areas efficiently. Unlike rotary-wing drones, fixed wing models are characterized by their ability to cover extensive territories in a single flight due to superior aerodynamic efficiency and longer endurance, making them particularly suitable for large-scale topographic mapping, forestry management, infrastructure inspection, and environmental monitoring. The LiDAR system emits laser pulses to measure distances to the Earth's surface, generating precise point clouds that can be used to create detailed digital elevation models (DEMs), digital terrain models (DTMs), and other geospatial products even in vegetated or complex environments where traditional photogrammetry may struggle. This combination of endurance, coverage, and high-accuracy data capture positions fixed wing LiDAR drones as a specialized tool within the broader drone and geomatics markets, catering to sectors that require rapid, accurate, and large-area 3D data acquisition.

The global Fixed Wing Lidar Drone market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.75% during the forecast period.
