In 2024, global production will reach 26,037 units, with an average selling price of US\$27,000 per unit. A flaking roller mill is a specialized machine used to compress grains, oilseeds, or other bulk materials into uniform flakes. Its core operating principle is to apply precisely controlled pressure between two high-strength steel rollers to compress the material into flakes. This equipment is typically equipped with an automatic control system that adjusts parameters such as roller gap, roller temperature, and speed to suit the processing requirements of different materials. The flaking process not only increases the surface area of the material, facilitating subsequent processing (such as oil extraction, cooking, and blending), but also improves digestibility and texture. It is widely used in the food, feed, and oil industries.

The global Flaking Roller Mill market size was estimated at USD 703.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
