Abstracts

Flame cutting machines, also known as oxy-fuel cutting systems, are industrial equipment designed to cut through ferrous metals?primarily steel?by utilizing a high-temperature flame generated from a controlled mixture of oxygen and a fuel gas (such as acetylene, propane, or natural gas) to heat the material to its ignition temperature, after which a high-purity oxygen stream is directed to oxidize and sever the metal along a predetermined path. These machines can be manually operated or integrated into computer numerical control (CNC) systems for automated, precision cutting of plates, sheets, or structural components, and are characterized by their ability to handle thick materials (often exceeding 200 mm), cost-effectiveness for large-scale operations, and versatility in both stationary and portable configurations, though they are generally limited to materials that support exothermic oxidation and may produce heat-affected zones or slag requiring secondary processing.

The global Flame Cutting Machines market size was estimated at USD 570.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
