Report Overview

As one of the five major engineering plastics, polycarbonate (PC) is widely used in electronic appliances, lighting, building materials, automotive parts, food packaging and medical devices due to its advantages of high strength, high transparency, high impact resistance and heat resistance. The glass transition temperature of PC is 140-150°, the heat deformation temperature is 135°, and the use range is from -60° to 120°. It has good thermal stability and dimensional stability. Although the flame retardant performance of PC is better than that of PE and PP, the limiting oxygen index (LOI) can reach 21%-24%, and the material itself can reach V-2 level flame retardant, it still cannot meet the higher requirements for flame retardant performance in special fields, and needs to be improved by adding flame retardants. Flame retardant for polycarbonate refers to additives or compounds used to improve the fire resistance of polycarbonate.

The global Flame Retardant for Polycarbonate market size was estimated at USD 128 million in 2023 and is projected to reach USD 188.59 million by 2032, exhibiting a CAGR of 4.40% during the forecast period.
