Abstracts

Flame retardant minerals are naturally occurring or synthetically produced inorganic materials, such as aluminum hydroxide, magnesium hydroxide, antimony trioxide, or various hydrates and boron compounds, that are incorporated into polymers, textiles, construction materials, and other products to suppress or delay the spread of fire by endothermic decomposition, dilution of flammable gases, or formation of protective char layers. These additives function through mechanisms like cooling the substrate, releasing water vapor, or creating a barrier to oxygen, thereby meeting stringent fire safety standards without releasing significant toxic halogenated compounds, making them environmentally preferable alternatives to halogen-based flame retardants in many applications.

The global Flame Retardant Mineral market size was estimated at USD 5014.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
