Report Overview:

Flame retardant performance is one of the main indexes affecting the quality of textiles and clothing. Ordinary regenerated cellulose fiber textiles are considered to be dangerous inflammables. This hinders the development of regenerated cellulose fiber to a certain extent.

Taking viscose fiber as an example, viscose fiber has the advantages of good moisture absorption, comfortable wearing, renewable raw materials and good dyeing. It has been widely used in textile industry. But at the same time, viscose fiber is a flammable fiber. Due to the unqualified flame retardant index, there are not a few cases of return of viscose fiber fabrics for export. In order to further expand the application scope of viscose fiber, the flame-retardant viscose fiber industry has developed rapidly. Flame retardant viscose fiber is a kind of fiber with great development potential among flame retardant fibers. It has excellent flame retardant, heat insulation and droplet resistance. It has the characteristics of ecology and comfort. It is a representative fiber with both function and safety.

The Global Flame Retardant Regenerated Cellulose Fibre Market Size was estimated at USD 272.75 million in 2023 and is projected to reach USD 351.14 million by 2029, exhibiting a CAGR of 4.30% during the forecast period.
