Abstracts

Flame retardant sponge is a specialized polyurethane foam material treated with chemical additives or manufactured with inherently fire-resistant polymers to significantly reduce its flammability, slow the spread of flames, and often achieve self-extinguishing properties once the ignition source is removed. These additives may include halogenated or phosphorus-based compounds, melamine derivatives, or intumescent agents that form a protective char layer when exposed to heat. The material is engineered to meet specific fire safety standards and regulations, such as UL 94, ASTM E84, or various international building and transportation codes, while retaining key physical properties of traditional sponge, such as flexibility, cushioning, and absorption. It is distinct from standard sponge primarily in its enhanced fire performance, making it suitable for applications where fire risk must be minimized.

The global Flame Retardant Sponge market size was estimated at USD 1584.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
