Report Overview

Flame Spraying is a thermal spraying process used in various industries for the application of protective and functional coatings onto a wide range of substrates. This technique involves the use of a high-temperature flame, typically generated by a combustion of a fuel gas and oxygen, to melt a feedstock material, such as metal or ceramic powders. The molten material is then propelled onto the substrate surface, where it rapidly solidifies, forming a coating. Flame Spraying is known for its ability to produce high-quality coatings with excellent adhesion, wear resistance, and corrosion protection. It is commonly used in applications such as corrosion protection, wear resistance, and thermal insulation, particularly in aerospace, automotive, and industrial sectors.
