Abstracts

Flap rudder, a high-lift rudder developed by German flap rudder specialist Willi Becker. It consists of a blade with a trailing edge flap activated by a mechanical or hydraulic system, thus producing a variable flap angle as a function of the rudder angle. Flap rudders give a much higher lift per rudder angle and a 60% to 70% higher maximum lift compared to the conventional rudder of same shape, size and area. In addition, the high balanced area improves manoeuvring characteristic at the low speeds by blocking the forward thrust of the propeller. High-lift flap rudders are specified for vessels which require better manoeuvrability than a conventional rudder, can provide.
