Abstracts

Flash Evaporation Systems are thermal desalination or separation technologies that rapidly evaporate part of a liquid—typically water—by suddenly exposing it to a lower pressure environment, causing it to "flash" into vapor. This process relies on the principle that when a liquid under high pressure is released into a low-pressure chamber, it quickly boils and partially evaporates without needing additional heat. The vapor is then condensed and collected as purified liquid, while the remaining brine or concentrated solution is discharged. These systems are often used in seawater desalination and industrial applications for efficient separation and purification.

The global Flash Evaporation Systems market size was estimated at USD 55.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
