Report Overview:

There are three designs of these motors: slotless ironless, slotless iron, and slotted iron. Again, all types are brushless. To choose between these types of motors requires an understanding of the application. For example, the slotless-ironless flat motor consists of a series of coils mounted to an aluminum base. Due to the lack of iron in the forcer, the motor has no attractive force or cogging, which helps with bearing life in certain applications. Forcers can be mounted from the top or sides to suit most applications. Ideal for smooth velocity control such as scanning applications, this type of design yields the lowest force output of flat-track designs. Generally, flat magnet tracks have high magnetic flux leakage.

The Global Flat-type Linear Motors Market Size was estimated at USD 219.43 million in 2023 and is projected to reach USD 272.87 million by 2029, exhibiting a CAGR of 3.70% during the forecast period.
