Abstracts

A flat type rupture disc is a non-reclosing pressure relief device designed to burst at a predetermined pressure differential, providing fail-safe protection for pressurized systems by preventing overpressure conditions that could lead to equipment damage or hazardous incidents. It consists of a thin, precision-engineered metal membrane that seals the system under normal operating conditions but ruptures completely and instantaneously when the set pressure is exceeded, allowing for rapid pressure release. These discs are commonly used in industries where space constraints, cost efficiency, and reliability are critical, such as in chemical processing, oil and gas, pharmaceuticals, and aerospace, offering a simple, maintenance-free alternative to more complex relief valves, especially in applications involving corrosive media, high temperatures, or where zero leakage is mandatory.

The global Flat Type Rupture Disc market size was estimated at USD 420.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
