Abstracts

Flexible flat displays are a type of electronic visual interface that can be bent, folded, or rolled without losing functionality, made possible by using substrates such as plastic, metal foil, or flexible glass instead of rigid materials like traditional glass panels. These displays incorporate technologies such as OLED (Organic Light Emitting Diode) or AMOLED (Active-Matrix Organic Light Emitting Diode) due to their inherent flexibility and superior image quality, and they are increasingly integrated into consumer electronics like smartphones, wearables, and emerging applications in automotive interiors, smart home devices, and even rollable televisions. The key advantages driving adoption include enhanced durability, lightweight design, innovative form factors, and the potential for more immersive user experiences, while challenges remain in scaling manufacturing, reducing production costs, and ensuring long-term reliability under repeated mechanical stress.

The global Flexible Flat Displays market size was estimated at USD 5210.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
