Abstracts

Flexible printed electronics represent a class of electronic devices and components manufactured using printing techniques on flexible substrates such as plastic, metal foils, or paper, enabling bendable, stretchable, lightweight, and often low-cost electronic systems. Unlike conventional rigid electronics, these devices leverage additive processes like inkjet, screen, or gravure printing with functional inks (e.g., conductive, semiconductive, or dielectric) to create circuits, sensors, displays, antennas, and energy harvesting modules. Key characteristics include mechanical flexibility, thin form factors, and compatibility with roll-to-roll manufacturing, which supports high-volume production and integration into unconventional applications where traditional electronics are impractical. This technology spans a wide range of products, from wearable health monitors and flexible displays to smart packaging and Internet of Things (IoT) nodes, fundamentally bridging gaps between electronics, materials science, and innovative product design.

The global Flexible Printed Electronics market size was estimated at USD 12800.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.30% during the forecast period.
