Abstracts

Float zone silicon crystal refers to a high-purity form of silicon produced using the float zone (FZ) refining process, which involves melting and recrystallizing a polycrystalline silicon rod in a controlled environment to minimize impurities and defects. This method yields crystals with exceptionally low oxygen and carbon content, superior electrical properties, and high resistivity, making them ideal for applications requiring high-performance semiconductors, such as power devices, radiation detectors, and high-frequency components. Unlike the more common Czochralski (CZ) method, the float zone technique avoids contact with crucibles, reducing contamination and enabling the production of ultra-pure silicon with precise doping control.

The global Float Zone Silicon Crystal market size was estimated at USD 383.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.25% during the forecast period.
