Abstracts

A Floating Breakwater System is a wave-dissipating structure designed to reduce wave energy and protect coastal areas, harbors, marinas, and offshore structures from erosion and damage. Unlike traditional fixed breakwaters made of concrete or rock, floating breakwaters are buoyant structures that absorb and deflect wave energy while remaining anchored in place using mooring systems or piles. They are typically made from concrete, steel, HDPE (High-Density Polyethylene), or modular floating units filled with buoyant materials. Floating breakwaters are ideal for deep-water locations, environmentally sensitive areas, or locations where permanent structures are impractical, offering a cost-effective, flexible, and eco-friendly alternative to traditional coastal defense solutions.

The global Floating Breakwater System market size was estimated at USD 104.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
