Abstracts

A floating concrete breakwater is an innovative and adaptable coastal protection and water - calming structure. It consists of a concrete - based floating body, often with a carefully designed shape and buoyancy system, connected to a mooring system that secures it in place. Unlike traditional fixed - base breakwaters, its floating nature allows it to respond to changes in water depth and wave conditions. One of the key advantages of a floating concrete breakwater is its versatility in deployment. Since it is not dependent on a specific seabed condition or water depth, it can be installed in a wide range of coastal areas, from shallow bays to deeper offshore waters. This makes it an ideal choice for protecting areas where the construction of a traditional fixed - base breakwater would be challenging due to soft sediments, high tidal ranges, or extreme water depths. When waves approach a floating concrete breakwater, the structure moves with the waves. This movement allows it to absorb and dissipate wave energy through a combination of mechanisms. The shape of the floating body can be designed to disrupt the wave patterns, causing the waves to break or lose their energy as they interact with the structure. Additionally, the mooring system plays a role in damping the movement of the breakwater, further reducing the impact of the waves. Floating concrete breakwaters find applications in various settings. In ports and marinas, they can create a calm and safe area for boats to dock, protecting them from the effects of large waves and strong currents. They are also used to safeguard coastal infrastructure such as power plants, water treatment facilities, and coastal resorts from the erosive forces of the sea. In the context of aquaculture, these breakwaters can enclose and protect fish farms and shellfish beds, providing a stable environment for the growth of aquatic organisms. Overall, the floating concrete breakwater offers a practical and effective solution for a variety of coastal and marine protection needs.

The global Floating Concrete Breakwater market size was estimated at USD 1139.0

million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.70% during the forecast period.
