Abstracts

Floating LNG pretreatment refers to the offshore processing of raw natural gas to remove impurities such as water, carbon dioxide, hydrogen sulfide, and heavier hydrocarbons before the gas is liquefied onboard a floating liquefied natural gas (FLNG) facility. This process is critical for meeting the stringent quality specifications required for LNG production, as it prevents operational issues like hydrate formation, corrosion, and inefficiencies in downstream liquefaction. By integrating pretreatment directly on floating units, operators can develop remote or stranded gas reserves without the need for extensive subsea pipelines or onshore infrastructure, enabling more flexible and cost-effective gas monetization in challenging marine environments.

The global Floating Lng Pretreatment market size was estimated at USD 980.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
