Abstracts

Dynamic inter-array cable (DIAC) systems are a critical component in any floating offshore wind project, ensuring efficient power transmission from the turbines. They are a single point of failure in the turbine?substation system and hence cable system failures can result in expensive remedial works as well as downtime from multiple turbines. A key difference from fixed-bottom wind farms is that inter-array cables in a floating wind farm are suspended between platforms and the seabed. As a result, these cables must be dynamic to withstand expected motions within the water column, as constrained by the mooring system.

The global Floating Offshore Wind Dynamic Inter Array Cable market size was estimated at USD 279.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
