Report Overview

Floating oil containment boom is a temporary barrier designed to contain and control oil spills in water bodies. The boom is typically made up of a series of floats that are connected by a flexible material, such as PVC or polyurethane. The floats keep the boom floating on the surface of the water, while the flexible material allows the boom to conform to the shape of the water and maintain its position in the event of wind, waves, or currents. They can be deployed in open water, coastal areas, ports, and harbors to contain and control oil spills. Booms can be anchored to the seabed, or they can be left to drift with the current.
