### Report Overview

Floating Production, Storage, and Offloading (FPSO) is a floating tank system used by the oil and gas industry particularly in offshore operations. Floating production vessels are built with processing facilities, allowing it to handle the oil or gas it receives from nearby platforms or templates. Processed oil or gas is stored in the FPSO until a sufficient amount has been collected to fill a tanker. At which point, the unit offloads the stored material using a loading hose into a tanker going ashore.

FPSO vessels are popular as they can be easily moved and installed to nearby platforms and also allow for easy transportation of oil to tankers or pipelines. Once an existing field has been depleted FPSO can then be moved to other locations. This makes them suitable for smaller fields which can be depleted quickly and avoids the need for installing permanent expensive pipelines.

The vessels often take the form of traditional tankers. In addition to dedicated vessels that are designed for FPSO, oil and gas tankers can be converted to an FPSO vessel which also makes them an economical and flexible option
