### Report Overview

Floating production systems are offshore production facilities that are used for the production of hydrocarbons. The process involved separates oil, water, gas, sand, and so on, and distributes the yields to storage, disposal, or transportation facilities. FPS are an essential component required for offshore oil and gas developments. FPS are used for drilling and exploration activities in offshore oil and gas production at various water depths.

The FPSO market segment accounted for about 62% of the total market share and dominated the market. FPSOs are mainly used by companies to extract crude oil through offshore drilling activities, It has a field storage capability and can be used in locations where there is no accessibility to pipeline infrastructure. Eliminating the requirement for pipeline infrastructure, FPSOs reduce operational costs for transporting crude oil.
