A floating rescue stretcher, also known as a buoyant or water rescue stretcher, is a specialized medical transport device designed to safely evacuate injured or incapacitated individuals from aquatic environments, such as open water, flood zones, or swift-moving rivers. It typically features an integrated flotation system, often utilizing inflatable chambers or buoyant materials, to keep both the patient and the device afloat during water-based operations. These stretchers are engineered to provide stability and patient security through features like harness systems, drainage capabilities, and attachment points for towing or helicopter evacuation, while also ensuring compatibility with standard medical equipment for continuous care during transit. Constructed from durable, corrosion-resistant materials, they are essential tools for search and rescue teams, lifeguard services, and emergency responders operating in maritime or flood-related incidents.
