Report Overview:

Flocculants are chemicals that promote flocculation by causing colloids and other suspended particles in liquids to aggregate, forming a floc. They are used in water treatment processes to improve the sedimentation or filterability of small particles. Flocculant, or pool floc, is a chemical that you add to your pool when other methods of clearing it up aren't working. The flocculants clump together floating particles in the water that are too small and light to sink to the bottom to be vacuumed up. Flocculants also help remove dirt from water.

The Global Flocculant Chemicals Market Size was estimated at USD 3651.87 million in 2023 and is projected to reach USD 4893.86 million by 2029, exhibiting a CAGR of 5.00% during the forecast period.
