## Abstracts

The flooded evaporator is a highly efficient heat exchange device in the refrigeration system. It achieves efficient heat absorption by completely filling the shell of the evaporator with refrigerant, so that the refrigerant maintains the maximum contact area with the outer surface of the heat transfer tube. In the flooded evaporator, the low-temperature and low-pressure liquid refrigerant occupies the entire evaporation chamber. When chilled water or other refrigerant flows through the internal heat exchange tube, the refrigerant absorbs heat from the refrigerant and gradually evaporates into a gaseous state. In this process, since the refrigerant is always in a full liquid state, continuous and uniform heat exchange is ensured, which improves the stability and efficiency of the system.

The global Flooded Evaporators market size was estimated at USD 3675.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
