## Abstracts

A floor standing condensing boiler is a type of heating system commonly used in residential and commercial buildings to provide warmth and hot water. Unlike traditional boilers, which waste heat through the flue, condensing boilers are designed to capture and reuse much of that heat. They do this by condensing water vapor in the exhaust gases, releasing additional heat in the process. This makes them more energy-efficient and environmentally friendly compared to non-condensing boilers. The "floor standing" aspect refers to their physical design, as they are typically larger units that stand on the floor rather than being wall-mounted. They are often chosen for their high efficiency, reliability, and ability to provide consistent heating and hot water.

The global Floor Standing Condensing Boiler market size was estimated at USD 1057.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
