## Abstracts

Oil condensing boilers are water heaters fueled by oil. They achieve high efficiency (typically greater than 90% on the higher heating value) by condensing water vapour in the exhaust gases and so recovering its latent heat of vaporisation, which would otherwise have been wasted. This condensed vapour leaves the system in liquid form, via a drain. In many countries, the use of condensing boilers is compulsory or encouraged with financial incentives. A floor-standing boiler is designed to be placed on the floor rather than mounted on a wall.

The global Floor Standing Condensing Oil Boiler market size was estimated at USD 346.24 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 2.00% during the forecast period.
