Report Overview

Collector is a kind of organic substance which can selectively act on mineral surface to make mineral particles hydrophobic. Collectors can generally be classified into three categories - non - ionic, anion and cation. Nonionic collectors are simple hydrocarbon oils. Anionic and cationic collectors contain polar components that selectively adhere to mineral surfaces, as well as non-polar components that are incorporated into solutions and give mineral surfaces hydrophobicity. Collectors can be chemically bound to the mineral surface in highly selective ways (chemisorption) or retained on the mineral surface by physical forces (physical adsorption). The selection of collector is very important for the effective separation of minerals by flotation.
