Report Overview:

Flotation reagents are chemicals used to selectively separate minerals during the froth flotation process, which is a widely used method for mineral processing. Flotation reagents work by making some minerals hydrophobic, or water-repelling, while others remain hydrophilic, or water-attracting. This selective separation is achieved by adding reagents to the mineral slurry, which then adheres to air bubbles in the mixture and floats to the surface.

The Global Flotation Reagent For Mineral Processing Market Size was estimated at USD 2038.27 million in 2023 and is projected to reach USD 2505.55 million by 2029, exhibiting a CAGR of 3.50% during the forecast period.
