Abstracts

Both flow batteries and fuel cells are important energy conversion batteries, and they have a wide range of applications in different fields. A flow battery is a liquid-mediated battery system in which electrochemical reactions take place. Flow batteries typically consist of two electrodes and an ion-exchange membrane. Ion-exchange membranes function in a flow battery to separate cations from anions while allowing the transport of ions between the two electrodes. Ion exchange membranes should have high ion conductivity, good mechanical strength and chemical stability. A fuel cell is a device that uses oxygen and fuel to directly generate electricity. In fuel cells, ion exchange membranes are used to isolate hydrogen, oxygen, and electrolyte solutions. The ion exchange membrane has high proton conductivity and prevents the mixing of hydrogen and oxygen to ensure the normal operation of the fuel cell.

The global Flow Batteries And Fuel Cells Ion Exchange Membranes market size was estimated at USD 1250.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.35% during the forecast period.
