Report Overview:

In flow chemistry, a chemical reaction is run in a continuously flowing stream rather than in batch production. In other words, pumps move fluid into a reactor, and where tubes join one another, the fluids contact one another. If these fluids are reactive, a reaction takes place. Flow chemistry is a well-established technique for use at a large scale when manufacturing large quantities of a given material. However, the term has only been coined recently for its application on a laboratory scale by chemists and describes small pilot plants, and lab-scale continuous plants. Often, microreactors are used

The Global Flow Chemistry Market Size was estimated at USD 73 million in 2021 and is projected to reach USD 154.2 million by 2028, exhibiting a CAGR of 13.27% during the forecast period.
