Abstracts

Flue gas desulfurization is a key environmental technology used to remove sulfur dioxide (SO₂) produced during industrial combustion to reduce acid rain and other air pollution. The most widely used FGD methods include wet, dry and semi-dry desulfurization. Wet desulfurization is the most common type. It removes SO₂ efficiently by introducing flue gas containing SO₂ into an absorption tower and reacting with limestone or lime water solution to produce calcium sulfite or gypsum precipitation. The desulfurization efficiency can reach more than 95%.

The global Flue Gas Desulfurization Process market size was estimated at USD 4959.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
