Abstracts

Flufenacet preparations are selective, systemic herbicides belonging to the chemical class of oxyacetamides, which are primarily used in agriculture for pre-emergence and early post-emergence control of grass weeds, particularly in crops such as corn, soybeans, cereals, and sugarcane. These formulations inhibit cell division in susceptible plants by targeting the synthesis of very-long-chain fatty acids, providing residual soil activity that suppresses weed germination and growth over an extended period. Typically applied as emulsifiable concentrates, suspension concentrates, or in combination with other active ingredients like isoxaflutole or metribuzin, flufenacet preparations are valued for their efficacy against key problematic weeds such as blackgrass, ryegrass, and wild oats, while demonstrating favorable crop safety profiles when used according to label recommendations. Their role is integral in integrated weed management strategies, especially in regions grappling with herbicide-resistant weed populations, though their use is subject to regulatory approvals and environmental considerations due to persistence and mobility in soil and water systems.

The global Flufenacet Preparations market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
