Abstracts

Fluid Bed Coating is a coating process in which solid particles (such as powders, granules, or tablets) are suspended in a stream of air or gas, creating a "fluidized" bed. The suspended particles are then coated with a layer of material, typically a liquid coating material, which solidifies upon drying, creating a uniform coating on the surface of the particles. This technique is widely used in the pharmaceutical, food, and chemical industries for various applications, including drug coating, particle encapsulation, and controlled release formulations.

The global Fluid Bed Coating market size was estimated at USD 1590.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
