Report Overview

Fluid Bed Cooler cools the material by passing a gas (most commonly air) through a perforated distributor plate which then flows through a layer (bed) of solids. The air performs two functions. First, the air flows through the bed of solids at a velocity sufficient to support the weight of the particles, which creates a fluidized state enabling the particles to flow. Second, the air in the fluid bed serves to cool the particles as it comes into direct contact with the solids material within the fluid bed chamber.
