Abstracts

Fluid Catalytic Cracking (FCC) is a critical refining process in the petroleum industry that breaks down large, high-boiling-point hydrocarbon molecules from crude oil into smaller, more valuable products such as gasoline, diesel, and olefins using a fluidized catalyst system, where fine powder catalysts circulate continuously between the reactor and regenerator to facilitate cracking reactions and burn off coke deposits, thereby enabling high efficiency, operational flexibility, and enhanced yield of light distillates. The global FCC market is driven by rising demand for transportation fuels, particularly gasoline, and petrochemical feedstocks, with growth concentrated in regions expanding refining capacity such as Asia-Pacific and the Middle East; however, the market faces challenges from the energy transition, including regulatory pressures to reduce carbon emissions, increasing adoption of electric vehicles, and competition from alternative refining technologies like hydrocracking, though ongoing innovations in catalyst formulations and process optimization aim to improve efficiency and environmental performance. Key players include technology licensors like Honeywell UOP, Axens, and Shell, as well as catalyst suppliers such as BASF, Grace, and Albemarle, with market dynamics influenced by crude oil prices, refining margins, and environmental policies shaping investment in capacity upgrades and retrofits.

The global Fluid Catalytic Cracking market size was estimated at USD 3580.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.45% during the forecast period.
