Abstracts

A fluid catalytic cracker (FCC) is a critical unit in petroleum refineries designed to convert heavy, high-boiling-point hydrocarbon fractions?such as vacuum gas oil?into more valuable, lighter products like gasoline, diesel, and propylene by using a fluidized catalyst bed. The process involves cracking large hydrocarbon molecules through contact with a hot, powdered catalyst suspended in a rising stream of vaporized feed, enabling efficient heat transfer, continuous catalyst regeneration, and high conversion rates. FCC units are integral to maximizing refinery yield and flexibility, as they significantly boost the production of high-demand transportation fuels and petrochemical feedstocks, while also managing the yield of heavier byproducts like slurry oil and coke.

The global Fluidised Catalytic Crackers market size was estimated at USD 3450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
