Abstracts

The boiling granulation dryer uses powder granulation technology to fluidize the powder particles of the material in a ring state in the raw material container (also called a fluidized bed). These particles are preheated and mixed by purified heated air, and the adhesive solution is sprayed in atomization to make several particles aggregate into granules containing adhesive. As the hot air continues to dry the material, the moisture in the granules gradually evaporates and the adhesive solidifies. This process is repeated continuously, and finally an ideal, uniform, microporous spherical granules are formed.

The global Fluidized Bed Granulation Dryer market size was estimated at USD 142.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.10% during the forecast period.
