### Report Overview

Fluorescein angiography uses sodium fluorescein as a film-forming agent for rapid injection into the forearm vein. When sodium fluorescein enters the blood vessel of the fundus with the blood flow, it passes through a set of color filters of the fundus camera to continuously photograph the dye circulation outside the fundus blood vessel. When the form of fluorescence emitted by the excitation light is received, observe the dynamic reincarnation of the retina in this process, so that you can experience the fine structure of the fundus blood vessels and the changes of micro-reincarnation.
