Abstracts

Fluorescence guided surgery (FGS), (also called 'Fluorescence image-guided surgery', or in the specific case of tumor resection, 'fluorescence guided resection') is a medical imaging technique used to detect fluorescently labelled structures during surgery. Similarly, to standard image-guided surgery, FGS has the purpose of guiding the surgical procedure and providing the surgeon of real time visualization of the operating field. When compared to other medical imaging modalities, FGS is cheaper and superior in terms of resolution and number of molecules detectable.
