Abstracts

Fluorescence intraoperative navigation equipment is an advanced medical imaging system used during surgeries to enhance the surgeon's ability to visualize critical structures and tissue details in real-time. By using fluorescent dyes or agents that emit light when illuminated by specific wavelengths, this system allows for high-contrast imaging of tissues such as tumors, blood vessels, and nerves during the operation. Surgeons can use this technology to guide them in removing malignant tissues, identifying vital organs, and minimizing damage to healthy structures. The system integrates with existing navigation tools and provides a more precise and effective way to conduct surgeries, particularly in complex procedures like cancer resections, neurosurgeries, and reconstructive surgeries.

The global Fluorescence Intraoperative Navigation Equipment market size was estimated at USD 125.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.60% during the forecast period.
