Abstracts

A Fluorescent Antibody Test (FAT) is an immunological diagnostic technique that utilizes antibodies conjugated with fluorescent dyes to detect the presence of specific antigens in biological samples, commonly applied for identifying pathogens, autoimmune markers, or cellular proteins through fluorescence microscopy or automated imaging systems. This method relies on the high specificity of antigen-antibody binding and the visualization of fluorescence signals, making it a cornerstone tool in clinical diagnostics, veterinary medicine, and biomedical research for applications such as infectious disease screening (e.g., rabies, influenza, or Lyme disease), cancer biomarker detection, and immunological studies. The test can be performed as either a direct assay, where labeled primary antibodies bind directly to the target antigen, or an indirect assay, which employs unlabeled primary antibodies followed by fluorescently labeled secondary antibodies for signal amplification, enhancing sensitivity and flexibility across diverse sample types including tissues, cells, or bodily fluids.

The global Fluorescent Antibody Test market size was estimated at USD 620.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
