Abstracts

Fluorescent microspheres are polymer or silica-based spherical particles, typically ranging from nanometers to micrometers in size, that are embedded with fluorescent dyes or quantum dots to emit light of specific wavelengths when excited by an appropriate light source. These particles are engineered for high uniformity in size, surface chemistry, and fluorescence intensity, making them indispensable as calibration standards, tracer particles, and detection tools in fields such as flow cytometry, immunoassays, biomedical imaging, and environmental monitoring. Their surface can be functionalized with various biomolecules (e.g., antibodies or streptavidin) to enable targeted binding, enhancing their utility in diagnostic applications, drug delivery research, and as reference materials in quantitative analysis.

The global Fluorescent Microsphere market size was estimated at USD 115.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.45% during the forecast period.
