Abstracts

The working principle of the X-ray fluorescence coating thickness gauge is based on the X-ray fluorescence effect. The instrument will emit a beam of high-energy X-rays to the surface of the object to be measured. These X-rays interact with the atoms in the sample, causing the atoms to absorb the energy of the X-rays and be excited, releasing secondary X-rays (fluorescence radiation). Each chemical element releases X-rays of a specific energy, so by measuring the characteristic energy and intensity of these released secondary X-rays, the X-ray analyzer can perform qualitative and quantitative analysis of the coating thickness and composition of the material being measured.

The global Fluorescent X-ray Coating Thickness Gauge market size was estimated at USD 54.1 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.70% during the forecast period.
